

METHOD OF UPDATING SOFTWARE IN A HOST-CLIENT NETWORK

Abstract

A method for updating software in a plurality of clients connected to a host through a network includes connecting an updating device to the host, the updating device storing updated software to be used for updating software stored in the clients. Next, communication is initiated between the updating device and the host, and the updating device transmits the updated software to the host. The host then uploads the updated software to each of the clients for replacing previous versions of software stored in the clients with the updated software.
